ENTERPRISE WEB APPLICATION • CLIENT SERVER DEPLOYMENT

Candidate Placement & Claims Management System

A centralized, audit-compliant web application for managing candidate employment lifecycles, automated 180-day and 365-day claim milestone dispatch, multi-status dispute resolution, and payment reconciliation.

PREPARED BY
SaNDS Lab Middle East W.L.L.
Salmabad, Kingdom of Bahrain

1. Executive Summary & Project Purpose

SaNDS Lab Middle East W.L.L. is pleased to submit this streamlined Software Development and Workflow Automation Proposal to engineer and deploy a centralized, web-based **Candidate Placement & Claims Management System** built with **PHP, MySQL, and React.js**, deployed directly on the **client's designated server**.

Currently, the placement and employment verification workflow is managed through complex, manual spreadsheets (such as *Placement and Claims Sheet 2026*), tracking over 480 candidate records across multiple case managers. While these spreadsheets contain vital business logic, they create critical operational risks: manual date tracking for claims, absence of concurrent user permissions, risk of corrupted calculation formulas, lack of audit trails for disputed or terminated claims, and decoupled payment reconciliation.

The proposed system transitions operations into an agile, role-governed web application in an expedited **10 working days** timeline. It automates candidate milestone notifications at **Day 0 (Initial Placement)**, **Day 180 (6-Month Claim)**, and **Day 365 (12-Month Claim)**, supports manual claim amount logging, handles structured dispute workflows, and provides real-time executive dashboards.

480+	10 Days	PHP + MySQL	BHD 400
MIGRATED PLACEMENTS	RAPID TURNAROUND	REACT.JS FRONTEND	TOTAL INVESTMENT

2. About SaNDS Lab (www.sandslab.com)

Founded in **2008**, SaNDS Lab is a premier technology and software engineering consultancy with over **17 years of excellence** delivering mission-critical enterprise applications, Artificial Intelligence platforms, hardware security systems, and smart automation across the Middle East and Asia. SaNDS Lab operates under regional commercial registration in Bahrain alongside corporate development centers at Infopark Thrissur, Kerala.

Core Competencies & Divisions

- **AI & Software Engineering:** Enterprise cloud applications, high-concurrency relational data systems, automated business workflows, and API architectures.
- **Hardware & Security:** Biometric verification, AI-driven surveillance, and secure infrastructure.
- **Education & Corporate Training:** SaNDS Lab Academy providing advanced corporate software and AI enablement.
- **Smart Automation:** Specialized workflow and environmental automation solutions.

Enterprise Products & Pedigree

- **ShareJob (HR & Placement SaaS):** Automated recruitment, candidate tracking, and corporate billing.
- **PaymentLink:** Branded payment collection, invoice reconciliation, and financial ledger engines.
- **CCTV AI & Attendance Pro:** Vision intelligence and GPS-enabled workforce management.
- **Quality Standards:** Adherence to strict international quality standards in software architecture and delivery.

Quality Assurance Guarantee: SaNDS Lab guarantees full compliance with Bahrain Personal Data Protection Law (PDPL), role isolation, encrypted data transmission, and audit logs.

3. Operational Challenges & Milestone Automation Need

An architectural review of the client's current operational spreadsheet workflows (*Placement and Claims Sheet 2026*) identifies critical operational risks inherent to managing over 480 candidate placements and hundreds of claims in manual files. The proposed web system directly addresses these vulnerabilities by establishing automated milestone monitoring, strict role-based governance, and immutable financial audit trails:

3.1 Missed Claim Milestones & Financial Leakage

Vulnerability: Employment claims span a 12-month lifecycle (Initial Placement, 6 Months, and 12 Months). In Excel, identifying due claims requires staff to manually scan dates. Milestones reaching +180 or +365 days are frequently delayed or missed, causing blocked cashflow and claim leakage.

Solution: Automated daily cron engine monitors employment start dates and dispatches proactive dashboard badge alerts and email reminders to responsible case managers before milestones lapse.

3.2 Lack of Multi-User Concurrency & Access Control

Vulnerability: Multiple case managers (Husain, Dina, Meaad, Malak, Zainab Mattar, etc.) currently access a single shared spreadsheet. This creates severe file-locking conflicts, risk of unauthorized edits to salary or claims, and accidental cell corruption.

Solution: Enterprise Role-Based Access Control (RBAC). Each case manager has an authenticated individual login with access restricted to assigned candidates, while Administrators maintain global oversight.

3.3 Unstructured Dispute Handling & Audit Non-Compliance

Vulnerability: Disputed claims (resignation, probation termination, employer disagreement) are recorded as unstructured text notes. If a dispute fails, records are often deleted from active sheets, destroying historical audit trails required for regulatory inspection.

Solution: Governed dispute state machine. Captures structured dispute categories and remarks, enables safe reinstatement to active collection, and ensures non-destructive permanent archival for terminated claims.

3.4 Decoupled Collections & Financial Reconciliation Gaps

Vulnerability: Payment receipts are not systematically linked to individual claims. Tracking partial payments, cheques, and remaining candidate balances across multiple sheets leads to financial blind spots and manual reconciliation errors.

Solution: Dedicated claims payment ledger supporting multi-receipt partial collections, automatic remaining balance calculation, receipt logging, and 1-click reconciliation reports.

3.5 Strategic Impact: Current Excel vs. Proposed Automated System

Operational Dimension	Current Excel Spreadsheet Process	Proposed Web-Based Management System
Milestone Tracking	Manual scanning of joining dates; prone to missed 6M/12M deadlines.	**Automated daily cron evaluation (+180d, +365d) with push & email alerts.**
Multi-User Access	Single shared file; concurrent editing conflicts and data overwrite risks.	**Concurrent multi-user web access on client server with strict case manager role isolation.**
Dispute Management	Free-text comments; unstandardized resolution; risk of record deletion.	**Structured dispute lifecycle with safe reinstatement and permanent audit logs.**
Financial Collections	Decoupled receipt tracking; manual calculation of outstanding balances.	**Centralized ledger supporting multi-receipt partial payments & auto-reconciliation.**

4. End-to-End Business Workflow & State Architecture

The proposed solution digitizes the full operational lifecycle into four interconnected workflow pipelines: Candidate Onboarding, Milestone Automation, Dispute Resolution, and Financial Ledger Reconciliation.

4.1 Master Operational Lifecycle Workflow

Figure 4.1: Candidate Placement, Milestone Trigger, and Multi-Receipt Financial Reconciliation Engine Architecture

4.2 Claim Status & Dispute State Machine

Every claim moves through a deterministic finite-state machine ensuring zero ambiguity between financial collection and legal or employer dispute states:

A. UNDISPUTED WORKFLOW

Claims verified and accepted for active collection. Instantly dispatched to the payment collection module to record partial receipts, track bank reference numbers, and reconcile outstanding balances.

B. DISPUTED HANDLING

Authorized case managers record dispute reasons (e.g., candidate resignation, termination during probation, contract discrepancy). Once resolved, claims can be safely reinstated to undisputed status without data loss.

C. NON-DESTRUCTIVE TERMINATION WORKFLOW

If a claim cannot be recovered, it is marked as **Terminated** with documented reason and manager approval. In strict compliance with regulatory accounting standards, terminated claims are removed from active accounts receivable but remain 100% permanently archived for future audit and review.

5. Scope of Work: Detailed Functional Modules

The proposed software system encompasses seven core functional modules, each engineered to address specific operational and regulatory needs:

Module 1: User Management & Access Control

- **Administrator Role:** Full system governance, creation of case manager accounts, master setting configuration, and audit logs.
- **Case Manager Role:** Individual logins (Husain, Dina, Meaad, Malak, Zainab Mattar, etc.) with scoped access to manage their assigned candidate portfolios.
- **Audit Trail:** System tracks timestamp and user identity for every modification or claim status update.

Module 2: Candidate Registration & Tracking

- **Demographics & Verification:** CPR validation, full legal name, gender, education level, and contact info.
- **Employment Parameters:** Employer CR number, company name, position, salary, and employment type.
- **Automatic Reference Generation:** Unique identifier formatting (e.g., `JCP/26/268524`) with duplicate prevention.

Module 3: Milestone Automation & Alerts

- **Trigger 1 (Placement):** Immediate eligibility upon confirmation of joining date.
- **Trigger 2 (6 Months):** Automated trigger at `Joining Date + 180 Days`.
- **Trigger 3 (12 Months):** Automated trigger at `Joining Date + 365 Days`.
- **Proactive Alerts:** Dashboard badge counters and automated email alerts sent to the assigned case manager.

Module 4: Manual Claim Amount Entry & Milestone Recording

- **Manual Amount Input:** Authorized case managers directly input the agreed claim amount in BHD for each candidate milestone upon generation. The system does not calculate amounts automatically.
- **Milestone Binding & Metadata:** System captures claim date, milestone category (Placement, 6M, 12M), candidate reference number, entered amount, and case manager identity.
- **Duplicate Claim Prevention:** Prohibits duplicate claim entries for the same candidate and milestone while maintaining complete historical status logs.

Module 5: Claims Dispute & Termination

- **Categorized Dispute Filing:** Classifies disputes (probation termination, employer dispute, wage issue).
- **Resolution Workflow:** Reinstates validated claims back to active collection or transitions unrecoverable claims to Terminated status.
- **Immutable History:** Zero physical deletion of historical claims.

Module 6: Payment Collection & Ledger

- **Multi-Receipt Collections:** Allows recording multiple partial payments against a single claim.
- **Financial Reconciliation:** Automatically computes Collected Amount and Outstanding Balance.
- **Audit Reference:** Logs cheque number, bank transfer reference, receipt date, and cashier notes.

Module 7: Executive Dashboards & 10 Core Management Reports

Comprehensive reporting suite supporting date ranges, case manager portfolio filters, and 1-click export to Excel / PDF:

- Candidate Placement Report
- Claim Milestones Report (Day 0, 180, 365)
- Unclaimed Milestones Report
- Claims Summary Report
- Disputed Claims Report
- Terminated Claims Report
- Payment Collection Report
- Outstanding Balance Report
- Financial Reconciliation Report
- Case Manager KPI Performance Report

6. System Demonstration: Milestone Tracking & Claim Entry Interface

In accordance with operational requirements, claim amounts are not calculated automatically by the system. The prototype interface below illustrates how an authorized user selects an eligible candidate milestone and manually enters the agreed claim amount, candidate reference, and remarks for processing:

Manual Claim Amount Entry & Milestone Recording Architecture

In accordance with project scope, claim amounts are not computed automatically. Authorized case managers directly enter agreed claim amounts upon reaching milestone eligibility:

1. Milestone Alert: System detects Day 0, Day 180, or Day 365 trigger.	**2. Manual Amount:** Case manager inputs agreed BHD amount.	**3. Duplicate Check:** Engine verifies no existing claim for same milestone.	**4. Ledger Queuing:** Record dispatched to active payment collection.

→ **Supports full historical tracking of claim date, milestone, candidate reference, entered amount, remarks, and user identity.**

7. Technical Architecture, Security & Client Server Deployment

Technical Stack & Web Application

- **Frontend Layer:** Ultra-responsive Single Page Web Application (SPA) built with **React.js**, providing real-time status filtering and streamlined milestone claim dialogs.
- **Backend REST API:** High-performance **PHP** REST API services handling candidate validation, manual claim entry endpoints, authentication, and daily cron dispatchers.
- **Database Layer:** ACID-compliant relational **MySQL** database ensuring data integrity, indexed searches, and relational linkages between candidates, claims, and receipts.
- **Server Hosting & Deployment:** Web application deployed directly onto the **Client Server** (cPanel, Linux/Windows VPS, or on-premise). Server access details are to be provided by the client, and SaNDS Lab will execute the full deployment and configuration with zero third-party subscription fees.

Security & Bahrain PDPL Compliance

- **Data Protection:** Full alignment with Bahrain Personal Data Protection Law (Law No. 30 of 2018) for candidate CPR records and corporate data.
- **Encrypted Transport:** 256-bit TLS/SSL encryption configured on client server for all web traffic.
- **Role Isolation:** Case managers access only assigned candidates; Administrators retain multi-portfolio visibility.
- **100% Client-Owned Infrastructure:** All candidate placements and claims data reside exclusively on the client's provided server with complete privacy. Server infrastructure and backups are managed directly by the client.

8. Implementation Timeline (10 Working Days)

The complete web application will be engineered, migrated, and deployed within a total timeline of **10 working days** from official project kickoff and provision of client server access credentials:

Stage 1: Architecture & Data Modeling
Functional specifications review, MySQL relational schema modeling, PHP REST API routing, and React.js frontend environment setup.

Stage 2: Core Placement & Claims Workflow
Candidate placement registration, role-based access control, automated milestone trigger alerts (+180d, +365d), manual claim entry interface, and dispute workflows.

Stage 3: Ledger, Reports & Data Migration
Payment collection ledger with partial receipts, 10 specialized operational reports with export, and legacy data migration from existing Excel placement sheets (480+ records).

Stage 4: Client Server Deployment & Go-Live
Direct deployment and configuration onto the client's provided server, end-to-end user acceptance testing (UAT), staff operational walkthrough, and official production Go-Live.

Guaranteed Turnaround: Total project execution timeline is strictly **10 working days** from kickoff to production handover on the client's server.

9. Total Development Cost

SaNDS Lab offers a fixed, comprehensive commercial package covering the complete end-to-end development, data migration, and deployment of the web application:

TOTAL FIXED DEVELOPMENT COST

Candidate Placement & Claims Management Web Application

Includes PHP Backend, MySQL Database, React.js Frontend, 7 Core Functional Modules & Client Server Deployment.

Fixed Investment

BHD 400.000

9.1 Milestone Payment Schedule

Payment Milestone Description	Payment Percentage
Advance Payment upon Project Kickoff & Contract Signing	50%
Milestone Payment After Deploying to Client Server	40%
Final Payment Upon User Acceptance Testing & Go-Live	10%
Total Project Investment	100%

10. Project Deliverables & Warranty

- **Fully Deployed Application on Client Server:** Production-ready Candidate Placement & Claims Management System engineered in **PHP, MySQL, and React.js**, deployed and configured directly on the client's designated server with secure SSL web access.
- **Role-Based User Accounts:** Individual credential management for Administrators and Case Managers.
- **Automated Milestone Dispatcher:** Engine calculating Day 0, Day 180, and Day 365 claim triggers with notification badges.
- **Manual Claim Amount Entry Interface:** Streamlined data entry workflow for case managers to log claim amounts in BHD upon milestone eligibility.
- **Financial Reconciliation Ledger:** Modules tracking partial receipts, payment methods, and remaining balances.
- **10 Exportable Management Reports:** Standardized operational and executive reports with Excel/PDF export capabilities.
- **Migrated Legacy Data:** Ingestion and validation of historical placement records from agreed Excel sheets.
- **System Documentation & Training:** User operation manuals, administrative guides, and hands-on staff training sessions.
- **3 Months Post-Deployment Warranty:** Complimentary bug fixing and defect rectification directly on the client server against approved scope.

11. Assumptions & Exclusions

✓ Key Project Assumptions

- Claim amounts will be entered manually by authorized users based on agreed contract parameters.
- The client will provide server and database access credentials (cPanel, VPS, or hosting details) for SaNDS Lab to deploy and configure the web application. Server infrastructure maintenance and backups remain under client management.
- The client will provide one agreed, authoritative set of Excel/CSV source files for legacy migration.
- Client stakeholders will participate in scheduled milestone demonstrations and provide timely feedback.

✕ Scope Exclusions

- Third-party server hosting/VPS rental or domain fees (application is hosted on client server).
- Direct automated bank wire transfer APIs (collections tracked via internal ledger receipts).
- Custom feature additions outside this document will be handled via standard Change Request (CR).

12. Proposal Acceptance & Authorization

By signing below, the authorized representatives confirm their agreement to the functional scope, project timeline, deliverables, and commercial terms set forth in this proposal:
